Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT New isolated cancer associated nucleic acids and polypeptides - PT isolated using sera from cancer patients, used to develop products PT for the diagnosis, monitoring or treatment of cancers

CC The invention relates to a method for diagnosing a disorder characterised CC by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a CC biological sample isolated from a subject with an agent that specifically conduct complexed with an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the contaction between the agent and the NAM or the expression product as a CC determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. CC The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                            밁

CC The invention relates to nucleic acid sequences (V84411 to V84633) composition for the composition with the ATCC under deposit numbers ATCC gene sequences are deposited with the ATCC under deposit numbers ATCC (C 29799, 97974, 97975, 97976, 97977, 209087, 209088, 20909, 209010, CC 209011, 209080, 209081, 209082, 209082, 209010, CC 209011, 209080, 209081, 209082, 209083, 209085, 209511 Host CC ells comprising recombinant vectors containing the nucleic acid content for preventing, treating or ameliorating the secreted consecution of the secreted proteins. The polynucleotide and amino acid sequences are useful for are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides, based on which tissues they are most highly expressed in, and include developing creating the presence of materiant of the management of the polynucleotides.
                                                                                                                                                                    밁

Co-culture of two transformants is preferred where one synthesises the vitamer pimelic acid and the other converts the vitamer to biotin. See also N81551.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A second clone was isolated which contained bio C. The insert present in the plasmid of insert from pTG1400 were cloned together in plasmid (pTG1440) which complements biotin a process of the process of the plasmid (pTG1440) which complements biotin a process of the process o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; 6, 7, 8; 51pp; French.

DNA was isolated from B.sphaericus IFO 3525, cut with HindIII and the fragments sub-cloned into pBR322. The recombinant plasmids were used to transform E.coli bio- mutants. Plasmid pTG1400 was present in one clone (E.coli C600; CNCM I-608) which showed complementation for bio A and bio D. The plasmid contains a 4.3kb insert which includes 4 long open reading frames (LORFs) as described in the Features Table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 88-121306/18.

This gene was isolated by translocation breakpoint mapping. Fragments of the ALL-1 cDNA may be used to identify chromosomal abnormalities within the ALL-1 gene These fragments may be used in the treatment and diagnosis of human leukemias such as acute lymphocytic, myelomonocytic, monocytic and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid encoding a human tri:thorax protein - used to develop agents for diagnosis and treatment of diseases associated with disruption of chromosome II at q23 Claim 4; page 36-42; 68pp; English.

In the course of the construction of a physical map of human chromosome region 11q23, a region cond the t(4:11) translocation breakpoint was cloned. The cloned DNA encoded a protein homologous to the diagnosis and treatment of immunodeficiency states, developmental abnormalities, inherited diseases or cancers, e.g. acute lymphocytic leukaemia or acute myelomonocytic leukaemia. Sequence 11907 BP; 3469 A; 2990 C; 2735 G; 2709 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 13; Page 88-92; 136pp; English.

The sequence is that of cDNA clone 14P-18B, derived from the ML gene and used as a probe in a method for detecting leukaemic ce containing 11q23 chromosome translocations. The method is usefu in the diagnosis and monitoring of certain types of leukaemia using northern and Southern blot analysis and fluorescence in situ hybridisation (FISH). The probe detects rearrangements in dividing leukaemic cells and interphase nuclei.

The ALL-1 cDNA was obtained from a series of overlapping clones spanning 14.7 kb, isolated by screening a human fibroblast libra and a K562 library. The sequence revealed a single, long ORF predicting a protein of approx. 4000 amino acids. The predicted amino acid sequence includes regions of homology with the Drosophila trithorax gene which contain zinc-finger domains. The ALL-1 gene on chromosome 11 is involved in a series of chromosomal translocations which are associated with certain
                                                                                                                                                                                                                                   29-JUL-1997 (revised)

                                                                                                                                                         PT Detection of 11q23 chromosome translocation(s) - using myeloid/lymphoid PT leukaemia nucleic acid probes, for diagnosis and monitoring of PT leukaemia(s) and lymphoma(s) PT leukaemia(s) and lymphoma(s) PT leukaemia(s) and 11ymphoma(s) PS Claim 12; Column 43-48; 47pp; English.

CC Clones 14-7 and 14-18B. The clones are used as probes for 11q23 CC chromosome translocations associated with various human leukaemias.

CC Hybridisation of the probes to aberrant sized DNA segments is CC indicative of an 11q23 chromosome translocation. The probes are CC useful for the diagnosis and continued monitoring of various types CC inducation. The clones may also be used for protein prodn. (see R92705 and R92706) and hence antibody prodn.

CC (Revised entry submitted to correct sequence analysis breakdown.)

New Alzheimer's disease related gene, AD4 - used to develop prods.
PT New Alzheimer's disease related gene, AD4 - used to develop prods.
PT for detecting pre-disposition to or for diagnosis, prevention or
PT treatment of Alzheimer's disease
PS Claim 46; Fig 16; 83pp; English.

CC Agenetically isolated group of families with autosomal dominant
CC early-onset Alzheimer's Disease (AD) (the Volga German kindreds) has
CC AD4 gene was amplified from YAC 921d12 DNA and was radiolabelled by
CC AD4 gene was amplified from YAC 921d12 DNA and was radiolabelled by
CC AD4 gene was amplified from YAC 921d12 DNA and was radiolabelled by
CC inick translation. A human genomic clone hybridising to this fragment
CC was identified in a commercially available library. The clone carried
CC the entire AD4 gene and was sheared and subcloned into Mi3mpl8 vector
CC for sequence analysis. The sequences of the 12 exons and the flanking
CC intron sequences of the AD4 gene were determined. The present sequence
CC includes exon 5. Mutations in the AD4 gene, identified in Volga German
CC kindreds, are associated with Alzheimer's Disease, especially a
CC mutation at codon 141 which replaces Asn by Ile. Detection of mutant
CC AD4, for example using antibodies specific for the provides a means of
CC diagnosing Alzheimer's disease.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1414920-1417991 and 1520904-1522439). Subtraction by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /clone="IMAGE:2343999"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              on Jan 21, 1999 this sequence version replaced g1:3925571. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence is the entire insert of clone 477H23. The true left end of clone B107C2 (AL008724) is at 12724 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (28-JAN-1999) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            477H23 is from the library RPCI3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within know annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mapping group.

                                                                                                                                                                                                                                                                                               On Mar 22, 1999 this sequence version replaced gi:4455600. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence is the entire insert of clone 692C8. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequence map criteria as follows. An antempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments. Unfinished: dJ353E16 Contig_ID: 03404 acc=AL031591 Length: 73524 bp Unfinished: dJ353E16 Contig_ID: 03127 acc=AL031591 Length: 151971 bp.

* NOTE: This is a 'working draft' sequence.

* This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                     http://www.sanger.ac.uk/HGP/Chr20
692C8 is from the library RPC14 constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong. For further
